Partial differential equations for functions

$$\phi: \Omega \to M, \qquad \Omega \subset \mathbb{R}^d, \ d \ge 1,$$

 ${\cal M}$  a Riemannian manifold.

#### Applications:

- Cosserat shells and continua: S<sup>2</sup>, SO(3)
- Liquid crystals:  $S^2$ ,  $\mathbb{PR}^2$ , SO(3)
- ▶ σ-models: SU(2), SO(3)
- Image processing:  $S^2$ , Sym<sup>+</sup>(3)
- Positivity-preserving systems:  $\mathbb{R}^+$ , Sym<sup>+</sup>(3)
- ▶ [...]

## The challenge: Nonlinear function spaces

# Example: Magnetic skyrmions

Quasi-particle in a magnetic material

- Maps  $\mathbf{m}: \mathbb{R}^2 \to S^2$
- Minimizers of

$$E(\mathbf{m}) = \int_{\mathbb{R}^2} \left( \frac{1}{2} |\nabla \mathbf{m}|^2 + \kappa \, \mathbf{m} \cdot (\nabla \times \mathbf{m}) + \frac{h}{2} |\mathbf{m} - \mathbf{e}_3|^2 \right) dx$$

#### Dimensional reduction

Model thin solid object by 2d equation

## Kinematics:

- $\blacktriangleright \ \Omega \subset \mathbb{R}^2$
- Midsurface deformation:  $m: \Omega \to \mathbb{R}^3$

#### Dimensional reduction

Model thin solid object by 2d equation

## Kinematics:

- $\blacktriangleright \ \Omega \subset \mathbb{R}^2$
- Midsurface deformation:  $m: \Omega \to \mathbb{R}^3$
- Direction field:  $R:\Omega\to S^2$

#### Dimensional reduction

Model thin solid object by 2d equation

## Kinematics:

- $\blacktriangleright \ \Omega \subset \mathbb{R}^2$
- Midsurface deformation:  $m: \Omega \to \mathbb{R}^3$
- Microrotation field:  $R: \Omega \to SO(3)$

Partial differential equations for functions

 $\phi:\Omega\to M,\qquad \Omega\subset \mathbb{R}^d,\; d\geq 1,\qquad M\text{ a Riemannian manifold}.$ 

## Problem: Discretization

- ► Finite elements presuppose vector space structure
- ▶ But codomain *M* is nonlinear

## Find a discretization that:

- $\blacktriangleright$  works for any Riemannian manifold M
- ► is conforming
- is frame-invariant (i.e., equivariant under isometries of M)

## Theorem ([Nash])

For each manifold M there exists a smooth, isometric embedding into a Euclidean space  $\mathbb{R}^N.$ 

## Algorithm

- Interpolate in  $\mathbb{R}^N$
- ▶ Project back onto M

## Theorem ([Grohs, Sprecher, S, in prep.])

Optimal discretization error bounds.

#### Properties

► Simple and fast, if an "easy" embedding/projection is given

#### The unit sphere $S^m$

• 
$$\mathbf{v} \mapsto \frac{\mathbf{v}}{|\mathbf{v}|}$$

## The special orthogonal group SO(3)

- Polar decomposition
  - Minimization property
  - Closed-form expression available, but unwieldy
  - Better: evaluate iteratively
- Gram–Schmidt orthogonalization
- Embed into quaternions interpolate there

#### Symmetric positive definite matrices

- Open set in  $\mathbb{R}^{m \times m}$
- Projection?

# Generalizing Lagrangian Interpolation

## Reference element $T_{ref}$ :

- Arbitrary type
- Coordinates  $\xi$
- Lagrange nodes  $a_i$ ,  $i = 1, \ldots, m$
- Shape functions  $\{\varphi_i\}$  of *p*-th order

#### Lagrange interpolation:

Assume values  $v_1, \ldots, v_m \in M$  given at the Lagrange nodes.

If M is a vector space, interpolation between the  $v_i$  can be written as

$$\sum_{i=1}^{m} v_i \varphi_i(\xi) = \operatorname*{arg\,min}_{q \in M} \sum_{i=1}^{m} \varphi_i(\xi) \|v_i - q\|^2.$$

## Geodesic Interpolation

Idea: Generalize

$$\underset{q \in M}{\operatorname{arg\,min}} \sum_{i=1}^{m} \varphi_i(\xi) \|v_i - q\|^2.$$

to

$$\underset{q \in M}{\operatorname{arg\,min}} \sum_{i=1}^{m} \varphi_i(\xi) \operatorname{dist}(v_i, q)^2$$

 $(\operatorname{dist}(\cdot, \cdot)$  being the Riemannian distance on M)

## Definition (Geodesic interpolation [S '11, S '13, Grohs '12])

Let  $v_i \in M, \, i=1,\ldots,m$  be coefficients and  $\xi$  coordinates on  $T_{\mathsf{ref}}.$  Then

$$\Upsilon^{p}(v,\xi) = \operatorname*{arg\,min}_{q \in M} \sum_{i=1}^{m} \varphi_{i}(\xi) \operatorname{dist}(v_{i},q)^{2}$$

is the p-th order geodesic interpolation between the  $v_i$ .

#### Properties:

- Reduces to standard Lagrange interpolation if  $M = \mathbb{R}^m$
- Reduces to geodesics if d = 1, p = 1 (hence the name)

- ▶ p = 1: all weights  $\varphi_i(\xi)$  are nonnegative  $\longrightarrow$  [Karcher(1977)]
- p > 1: weights may become negative.

#### Idea:

There is a minimizer if the  $v_i$  are "close enough" to each other on M.

## Theorem ([S '12, Hardering '15])

Denote by  $B_r(p_0)$  the geodesic ball of radius r around  $p_0 \in M$ . There are constants  $D, \rho$  with  $0 < D < \rho$ , depending on the curvature of M and the total variation of the weights  $\varphi_i$ , such that if the values  $v_1, \ldots, v_m$  are contained in  $B_D(p_0)$  for some  $p_0 \in M$ , then the minimization problem has a unique local minimizer in  $B_\rho(p_0)$ .

## Differentiability:

## Lemma ([S '11])

Under the assumptions of the previous theorem, the function  $\Upsilon^p(v;\xi)$  is infinitely differentiable with respect to  $\xi$  and the  $v_i$ .

## Objectivity: Equivariance under an isometric group action

Lemma (Objectivity, [S '10, S '13])

For any isometry Q acting on M and any  $\xi \in T_{\text{ref}}$  we have

 $Q\Upsilon(v;\xi) = \Upsilon(Qv;\xi).$ 

Consequence: Discretizations of frame-invariant models are frame-invariant.

## Geodesic Finite Elements

Construct global finite element spaces:

## Definition (Geodesic finite elements)

Let M be a Riemannian manifold and G a grid for a d-dimensional domain,  $d \geq 1$ . A geodesic finite element function is a continuous function  $v_h : G \to M$ such that for each element T of G,  $v_h|_T$  is given by geodesic interpolation on T.

Denote by  $V_h^M$  the space of all such functions.

#### Nonlinear Sobolev space:

Let M be smoothly embedded into  $\mathbb{R}^m$ . Define

$$H^1(\Omega, M) := \{ v \in H^1(\Omega, \mathbb{R}^m) \mid v(s) \in M \text{ a.e.} \}$$

## Conforming discretization:

Lemma ([S '11])

Geodesic finite elements are conforming, i.e.,

 $V_h^M \subset H^1(\Omega, M).$ 

#### Minimize harmonic energy:

$$\phi: \Omega \to S^2, \qquad E(\phi) = \int_{\Omega} \|\nabla \phi\|^2 \, dx$$

#### Lemma

The inverse stereographic map minimizes E in its homotopy class.

## Setup

- Domain  $\Omega = [-5, 5]^2$
- Dirichlet boundary conditions
- Discretization error for d = 2, p = 1, 2, 3:

## Linear result:

## Theorem

Let J be a quadratic coercive functional on  $H_0^1(\Omega)$ . Let u be the minimizer of J in  $H_0^1(\Omega)$ , and  $u_h$  the minimizer in a p-th order Lagrangian finite element space contained in  $H_0^1$ . Then

$$||u-u_h||_{H^1} \le Ch^p |u|.$$

#### Questions for a proof in nonlinear spaces:

- What replaces the error  $||u u_h||_{H^1}$ ?
- Appropriate measure of solution regularity |u|?
- Ellipticity/coercivity in a nonlinear function space?

## Linear result:

#### Theorem

Let J be a quadratic coercive functional on  $H_0^1(\Omega)$ . Let u be the minimizer of J in  $H_0^1(\Omega)$ , and  $u_h$  the minimizer in a p-th order Lagrangian finite element space contained in  $H_0^1$ . Then

$$|u - u_h||_{H^1} \le Ch^p |u|.$$

#### Questions for a proof in nonlinear spaces:

- What replaces the error  $||u u_h||_{H^1}$ ?
- Appropriate measure of solution regularity |u|?
- Ellipticity/coercivity in a nonlinear function space?

#### Theorem ([Grohs, Hardering, S (2014), Hardering (2016)])

Optimal  $H^1$  and  $L^2$  discretization error bounds.

# Magnetic skyrmions

#### Magnetic skyrmion

- Quasi-particle in a magnetic material
- Maps  $\mathbf{m}: \mathbb{R}^2 \to S^2$
- Minimizers of

$$E(\mathbf{m}) = \int_{\mathbb{R}^2} \left( \frac{1}{2} |\nabla \mathbf{m}|^2 + \kappa \mathbf{m} \cdot (\nabla \times \mathbf{m}) + \frac{h}{2} |\mathbf{m} - \mathbf{e}_3|^2 \right) dx$$

## Problem settings

- Hexagonal domain
- Unstructured triangle grid
- Dirichlet boundary conditions
- ▶ Projection-based finite elements of orders 1, 2, 3

## Discretization errors:

## Wong, Pellegrino 2006:

- Shearing of a rectangular plastic sheet
- 380 mm x 128 mm x 25  $\mu$ m
- $E = 71240 \text{ N/mm}^2$ ,  $\nu = 0.31$
- Prescribed displacement at horizontal edges
- ▶ 3 mm shear

## Kinematics:

- $\blacktriangleright \ \Omega \subset \mathbb{R}^2$
- Midsurface deformation:  $m: \Omega \to \mathbb{R}^3$
- Microrotation field:  $R: \Omega \to SO(3)$

## Strain measures:

- Deformation gradient:  $F := (\nabla m | R_3) \in \mathbb{M}^{3 \times 3}$
- Translational strain:  $U := R^T F$
- Rotational strain:  $\mathfrak{K} := R^T \nabla R$

Hyperelastic material law: [Neff] (h =shell thickness)

$$J(m,R) = \int_{\Omega} \left[ hW_{\rm memb}(U) + \frac{h^3}{12} W_{\rm bend}(\mathfrak{K}) + hW_{\rm curv}(\mathfrak{K}) \right] dx$$

Membrane energy:

$$W_{\text{memb}}(U) = \mu \|\text{sym}(U-I)\|^2 + \mu_c \|\text{skew}(U-I)\|^2 + \frac{\mu\lambda}{2\mu+\lambda} \frac{1}{2} \Big( (\det U-1)^2 + (\frac{1}{\det U}-1)^2 \Big) \Big) + (\frac{1}{\det U}-1)^2 \Big) \Big| = \frac{1}{2} \Big( (\det U-1)^2 + (\frac{1}{\det U}-1)^2 \Big) \Big) \Big| = \frac{1}{2} \Big( (\det U-1)^2 + (\frac{1}{\det U}-1)^2 \Big) \Big) \Big) \Big| = \frac{1}{2} \Big( (\det U-1)^2 + (\frac{1}{\det U}-1)^2 \Big) \Big) \Big) \Big| = \frac{1}{2} \Big( (\det U-1)^2 + (\frac{1}{\det U}-1)^2 \Big) \Big) \Big) \Big| = \frac{1}{2} \Big( (\det U-1)^2 + (\frac{1}{\det U}-1)^2 \Big) \Big) \Big) \Big| = \frac{1}{2} \Big) \Big| = \frac{1}{2} \Big( (\det U-1)^2 + (\frac{1}{\det U}-1)^2 \Big) \Big) \Big) \Big| = \frac{1}{2} \Big) \Big| = \frac{1}{2} \Big( (\det U-1)^2 + (\frac{1}{\det U}-1)^2 \Big) \Big) \Big) \Big| = \frac{1}{2} \Big) \Big| = \frac{1}{2} \Big( (\det U-1)^2 + (\frac{1}{\det U}-1)^2 \Big) \Big) \Big) \Big| = \frac{1}{2} \Big) \Big| = \frac{1}{2} \Big( (\det U-1)^2 + (\frac{1}{\det U}-1)^2 \Big) \Big) \Big) \Big| = \frac{1}{2} \Big) \Big| = \frac{1}{2} \Big( (\det U-1)^2 + (\frac{1}{\det U}-1)^2 \Big) \Big) \Big| = \frac{1}{2} \Big) \Big| = \frac{1}{2} \Big( (\det U-1)^2 + (\frac{1}{\det U}-1)^2 \Big) \Big) \Big| = \frac{1}{2} \Big) \Big| = \frac{1}{2} \Big( (\det U-1)^2 + (\frac{1}{\det U}-1)^2 \Big) \Big) \Big| = \frac{1}{2} \Big) \Big| = \frac{1}{2} \Big( (\det U-1)^2 + (\frac{1}{\det U}-1)^2 \Big) \Big) \Big| = \frac{1}{2} \Big) \Big| = \frac{1}{2} \Big( (\det U-1)^2 + (\frac{1}{\det U}-1)^2 \Big) \Big) \Big| = \frac{1}{2} \Big) \Big| = \frac{1}{2} \Big( (\det U-1)^2 + (\frac{1}{\det U}-1)^2 \Big) \Big) \Big| = \frac{1}{2} \Big( (\det U-1)^2 + (\frac{1}{\det U}-1)^2 \Big) \Big) \Big| = \frac{1}{2} \Big( (\det U-1)^2 + (\frac{1}{\det U}-1)^2 \Big) \Big) \Big| = \frac{1}{2} \Big( (\det U-1)^2 + (\frac{1}{\det U}-1)^2 \Big) \Big) \Big| = \frac{1}{2} \Big( (\det U-1)^2 + (\frac{1}{\det U}-1)^2 \Big) \Big) \Big( (\det U-1)^2 + (\frac{1}{\det U}-1)^2 \Big) \Big( (\det U-1)^2 + (\frac{1}{\det U}-1)^2 \Big) \Big) \Big( (\det U-1)^2 + (\frac{1}{\det U}-1)^2 \Big) \Big( (\det U-1)^2 + (\frac{1}{\det U}-1)^2 \Big) \Big) \Big( (\det U-1)^2 + (\frac{1}{\det U}-1)^2 \Big) \Big( (\det U-1)^2 + (\frac{1}{\det U}-1)^2 \Big) \Big) \Big( (\det U-1)^2 + (\frac{1}{\det U}-1)^2 \Big) \Big( (\det U-1)^2 + (\frac{1}{\det U}-1)^2 \Big) \Big) \Big( (\det U-1)^2 + (\frac{1}{\det U}-1)^2 \Big) \Big( (\det U-1)^2 + (\frac{1}{\det U}-1)^2 \Big) \Big) \Big( (\det U-1)^2 + (\frac{1}{\det U}-1)^2 \Big) \Big( (\det U-1)^2 + (\frac{1}{\det U}-1)^2 \Big) \Big) \Big( (\det U-1)^2 + (\frac{1}{\det U}-1)^2 + (\frac{1}{\det U}-1)^2 +$$

## Bending energy:

$$W_{\text{bend}}(\mathfrak{K}_{\mathfrak{b}}) = \mu \|\text{sym}(\mathfrak{K}_{b})\|^{2} + \mu_{c} \|\text{skew}(\mathfrak{K}_{b})\|^{2} + \frac{\mu\lambda}{2\mu + \lambda} \operatorname{tr}[\text{sym}(\mathfrak{K}_{b})]^{2}$$

Curvature energy:

$$W_{\rm curv}(\mathfrak{K}) = \mu L_c^{1+p} \|\mathfrak{K}\|^{1+p}$$

## Theorem ([Neff])

Under suitable conditions, the functional J has minimizers in  $H^1(\Omega, \mathbb{R}^3) \times W^{1,1+p}(\Omega, SO(3)).$ 

## Experiment:

## Experiment:
